## SELECTED PROJECTS

---

### CoinWorks: Graph Analysis for the Blockchain Technology

*One of the first groups to analyze Blockchain graphs, at UT Dallas we introduced a novel concept of  $k$ -chainlets on Bitcoin that expands the ideas of motifs and graphlets to Blockchain graphs. Chainlet analysis provides a deeper insight into local topological properties of the Blockchain and the role of those local higher-order topologies in the Bitcoin price formation. In the entire history of the Bitcoin graph, we have found that certain types of chainlets have a high predictive utility for Bitcoin prices. So far, this ongoing project has resulted in three concluded publications. Further works are actively being developed.*

### Aetas: Temporal Rules Discovery for Web Data Cleaning

*In a collaboration with MIT CSAIL, at the Qatar Computing Research Institute we developed Aetas, a system for the discovery of approximate temporal functional dependencies. We used the data provided by RecordedFuture.com, which crawls the Internet and extracts knowledge with an event oriented approach. At the core of the system are two modules that exploit machine learning techniques to identify approximate dependencies and their duration from noisy web data. Our results appeared in the VLDB 2015 conference.*

### Sight: Personalized privacy for social networks

*To protect personal data in Online Social Networks (OSNs) against well-known privacy problems, several relationship-based access control mechanisms have been proposed, as well as, more expressive privacy settings have been adopted by commercial OSNs, like Facebook. Unfortunately, these efforts can be unproductive, because users are reluctant to set complex privacy preferences. To overcome this problem, we proposed a new model for privacy preference settings based on a risk concept. Our findings were presented at the IRI 2011, ICDE 2012 and ICDM 2012.*

### Taoss: Trend Analysis on Open Source Software

*Started as a Turkish Research Council project at Huawei Research, Taoss aimed at modeling the open source landscape by analyzing software repositories (e.g., Github), Q&A sites (e.g., StackOverflow), online forums (e.g., HackerNews) and other web sources. Taoss is internally deployed by Huawei as an analysis tool in planning software projects.*

### Crowd-Sourced Sensing and Collaboration Using Twitter

*We designed and implemented crowd-sourced sensing over Twitter, and showcased our system with two applications: a crowd-sourced weather radar, and a participatory noise-mapping application. In the project, we proposed a SensorML based classification for future detection of sensors on Twitter. Findings of this project were published in WOWMOM, 2010.*

### Upinion: Identifying Breaking Points in Public Opinion

*While polls are traditionally used for observing public opinion, they provide a point snapshot, not a continuum. We considered the problem of identifying breakpoints in public opinion, and proposed using micro-blogging sites to capture trends in public opinion. This, to the best of our knowledge, is the first paper to employ an emotion corpus to classify emotion changes. We used a combination of vector space and set space models to represent and analyze tweets from Twitter about public opinion on two breaking news stories.*
